

Standard Capacity Schedule

Series 2026 | DRAFT - allowances not yet published - not applicable to orders

This Standard Capacity Schedule defines the Standard Operating Capacity included in the Subscription Fees for standard Revomo Growth deployments. It is referenced by, and incorporated into, an Order Form as of that Order Form's date.

Modules determine what you can do. Capacity defines how much you can operate.

Where an Order Form records a different allowance for a dimension, that Order Form controls for that dimension. Where an Order Form is silent, this Schedule applies in full.

1. How capacity works

Included by default. Standard Operating Capacity is included in the Subscription Fees. It is not a separate charge and is not metered for billing purposes under standard Growth terms.

No automatic overage. Usage above an included allowance does not create an automatic or retroactive overage charge. Where usage materially exceeds an allowance for three consecutive months, Revomo gives notice and the parties discuss appropriate additional capacity in good faith. If additional capacity is not purchased, Revomo may require usage to return to the contracted allowance, subject to the Agreement.

Changing capacity. Additional capacity is agreed through an Order Form amendment. It is never applied retroactively and never invoiced without prior written agreement.

Versioning. This Schedule is versioned. An Order Form incorporates the version of this Schedule in effect on that Order Form's date; a later revision does not change an executed Order Form.

2. Data and retention

Active data / record capacity

Included allowance: Not yet published

The volume of commercial records under active management across the subscribed modules, counted as the number of live rows in datasets, price lists, views and rulesets that the Service maintains and recalculates.

Storage capacity

Included allowance: Not yet published

Total stored volume for Subscriber Data across production and non-production environments, including source extracts, imported files and generated outputs.

Data retention

Included allowance: Not yet published

The period for which historical records, versions and audit history remain queryable within the Service before archival.

3. Integrations and API

Standard integrations

Included allowance: Not yet published

The number of Standard Integrations maintained concurrently. A Standard Integration uses a generally supported Revomo integration pattern, connector, API, database extract or file-based exchange, without material customer-specific software development.

API capacity

Included allowance: Not yet published

Total volume of authenticated API calls across all integrations and custom clients in a billing period.

API rate limit

Included allowance: Not yet published

The sustained request rate a single tenant may issue before requests are throttled. Throttling protects service availability and is not a commercial charge.

4. Processing and environments

Data processing / scheduled workload

Included allowance: Not yet published

Routine pipeline execution, imports, analytical recalculation and scheduled jobs. This capacity is consumed by normal operation of any subscribed module, including where Predictive Modeling and Decision Optimization are not licensed.

Production environments

Included allowance: Not yet published

Environments serving live commercial decisions and published prices.

Non-production environments

Included allowance: Not yet published

Sandbox, staging and QA environments used for configuration, testing and validation.

5. Modeling, optimization and AI

Predictive and modeling capacity

Included allowance: Not yet published

Execution of elasticity, demand, win-probability and other predictive models where Predictive Modeling is subscribed.

Optimization capacity

Included allowance: Not yet published

Execution of scenario and price optimization workloads where Decision Optimization is subscribed.

AI and agent capacity

Included allowance: Not yet published

Copilot interactions and agent-executed actions across the subscribed modules, including tool calls made by agents operating within governed policy.

6. Measurement and notice

Measurement. Revomo measures capacity from its own production telemetry. Measurements are made available to Subscriber on request.

Notice. Where consumption approaches or exceeds an included allowance, Revomo notifies the Subscriber administrators named in the Order Form before any commercial conversation begins.

Fair use. Capacity supports the commercial, pricing, revenue and margin management purposes of the subscribed modules. The Service is not a general-purpose data warehouse or general-purpose compute platform.
